

## Exporting users

Exporting users is a fast way to create user accounts in Rational Change for all the users in your Rational DOORS database. Users are created in Rational Change with the *developer* role and with the appropriate roles to use the Rational DOORS-Change Integration, should you choose to do so. In addition, Rational DOORS group data is exported to Rational Change to ensure proper security when viewing proposed requirement changes.

The Export users option is only available if you have configured Rational DOORS to use “DOORS Local Directory” for user authentication rather than Rational Directory Service (RDS).

To export users:

1. On the main menu, select **Rational Change Integration > Define Configuration Templates**.  
The **Define Rational DOORS-Change Configuration Templates** dialog box opens.
2. Select the template representing the Rational Change server to which you wish to export, and then click **Export Users**.  
The **Export DOORS users** dialog box appears.
3. Click **Export Users**.  
The **Rational Change Login** dialog box appears.
4. Type the password for the admin user.  
Users are exported to Rational Change, and status messages are displayed in the status log.
